### **Assignment 3**

Pawanjeet Kaur 10/25/2019

Problem 2: Ex. 14[a-f] (Chapter 3, page 125) [2pt]

This problem focuses on the collinearity problem.

(a) Perform the following commands in R: The last line corresponds to creating a linear model in which y is a function of x1 and x2. Write out the form of the linear model. What are the regression coefficients?

```
set.seed(1)
x1=runif(100)
x2=0.5*x1+rnorm(100)/10
y=2+2*x1+0.3*x2+rnorm(100)
```

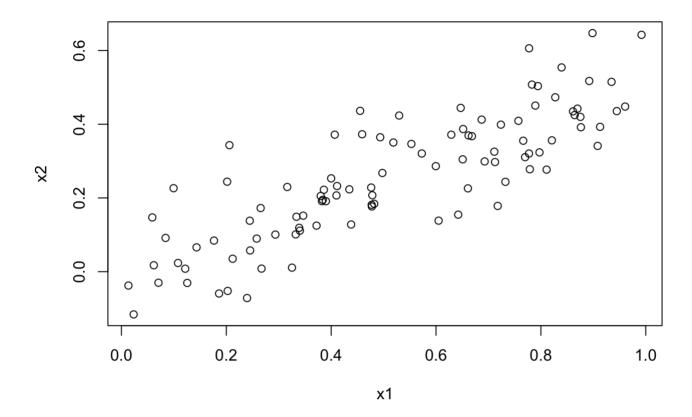

The regression coefficients are  $\beta 0 = 2 + rnorm(100)$ ,  $\beta 1 = 2$  and  $\beta 2 = 0.3$ 

(b) What is the correlation between x1 and x2? Create a scatterplot displaying the relationship between the variables.

```
cor(x1, x2)

## [1] 0.8351212

plot(x1, x2)
```

(c) Using this data, fit a least squares regression to predict y using x1 and x2. Describe the results obtained. What are  $\beta$ ^0,  $\beta$ ^1, and  $\beta$ ^2? How do these relate to the true  $\beta$ 0,  $\beta$ 1, and  $\beta$ 2? Can you reject the null hypothesis H0 :  $\beta$ 1 = 0? How about the null hypothesis H0 :  $\beta$ 2 = 0?

```
lm_fit <- lm(y ~ x1 + x2)
summary(lm_fit)</pre>
```

```
##

```

As the p-value is less than alpha we can reject ho

(f) Do the results obtained in (c)–(e) contradict each other? Explain your answer.

Yes the results in (c) to (e) contradict as we can see in part c we for  $\beta$ 1 we rejected null hypothesis and for  $\beta$ 2 we could not reject null hypothesis. Whereas in part d and e we rejected null hypothesis.

Problem 3: Ex. 5 (Chapter 4, page 169) [1pt]

#### We now examine the differences between LDA and QDA

a) If the Bayes decision boundary is linear, do we expect LDA or QDA to perform better on the training set? On the test set?

In QDA on test data the bias will decrease hence, QDA will perform better than LDA. Whereas if the Bayes decision boundary is linear, we know LDA has linear decision boundary hence LDA will perform better than QDA.

(b) If the Bayes decision boundary is non-linear, do we expect LDA or QDA to perform better on the training set? On the test set?

If bayes decision boundary is non linear, we can say QDA will perform better on both training and test sets

(c) In general, as the sample size n increases, do we expect the test prediction accuracy of QDA relative to LDA to improve, decline, or be unchanged? Why?

With increase in the sample size the accuracy of QDA will improve. As we know with increase in sample size for non linear methods the bias will decrease along with the variance of models.

(d) True or False: Even if the Bayes decision boundary for a given problem is linear, we will probably achieve a superior test error rate using QDA rather than LDA because QDA is flexible enough to model a linear decision boundary. Justify your answer.

False, for small value QDA is more prone to errors and add noise to model. Hence test errors in QDA will be high. So, LDA performs better in such scenario and given statement is false.

#### Problem 4: Ex. 6 (Chapter 4, page 170) [1pt]

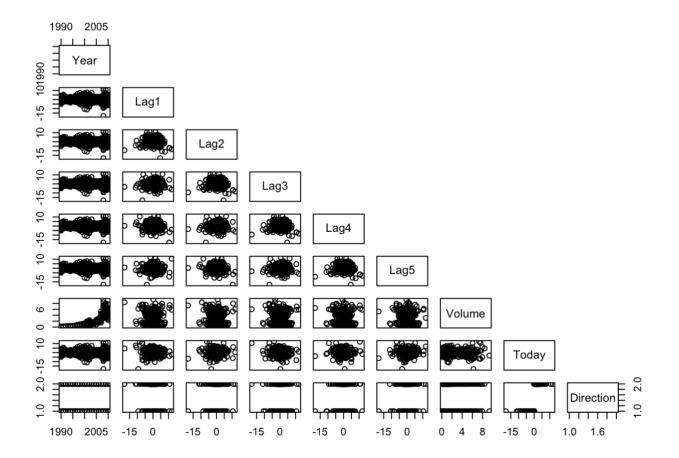

```
library(ISLR)
dim(Weekly)
## [1] 1089
str(Weekly)
## 'data.frame':

#### The LDA model with Lag2 as its only predictor did the best.

i) Experiment with different combinations of predictors, including possible transformations and interactions, for each of the methods. Report the variables, method, and associated confusion matrix that appears to provide the best results on the held out data. Note that you should also experiment with values for K in the KNN classifier.
